**Appendix: IC Revision history of SSD1309 Specification**

<b>Version</b>	<b>Change Items</b>	<b>Effective Date</b>
0.10	1 <sup>st</sup> Release	12-Oct-10
1.0	1. Changed to Advance Information 2. Add SSD1309UR1 in ordering information. (P.11 , P.55)	14-Oct-10
1.1	1. Added Command 26h/27h/29h/2Ah/2Eh/2Fh/A3h/DCh in Section 9 & Section 10 (P.28~31, P.33, P.45~48) 2. Revised default value of A[7:4] of command D5h in Table 9-5 from 1000b into 0111b. (P.34)	25-Jul-11

## 1 GENERAL DESCRIPTION

SSD1309 is a single-chip CMOS OLED/PLED driver with controller for organic / polymer light emitting diode dot-matrix graphic display system. It consists of 128 segments and 64 commons. This IC is designed for Common Cathode type OLED panel.

The SSD1309 embeds with contrast control, display RAM and oscillator, which reduces the number of external components and power consumption. It has 256-step brightness control. Data/Commands are sent from general MCU through the hardware selectable 6800/8080 series compatible Parallel Interface, I<sup>2</sup>C interface or Serial Peripheral Interface. It is suitable for many compact portable applications, such as mobile phone sub-display, MP3 player and calculator, etc.

## 2 FEATURES

- Resolution: 128 x 64 dot matrix panel
- Power supply
  - V<sub>DD</sub> = 1.65V ~ 3.3V for IC logic
  - V<sub>CC</sub> = 7.0V ~ 16.0V for Panel driving
- For matrix display
  - OLED driving output voltage, 16V maximum
  - Segment maximum source current: 320uA
  - Common maximum sink current: 40mA
  - 256 step contrast brightness current control
- Embedded 128 x 64 bit SRAM display buffer
- Pin selectable MCU Interfaces:
  - 8-bit 6800/8080-series parallel interface
  - 3 / 4 wire Serial Peripheral Interface
  - I<sup>2</sup>C Interface
- Screen saving infinite content scrolling function
- Programmable Frame Rate
- Programmable Multiplexing Ratio
- Row Re-mapping and Column Re-mapping
- On-Chip Oscillator
- Chip layout for COG , COF
- Wide range of operating temperature: -40°C to 85°C

## 3 ORDERING INFORMATION

**Table 3-1: Ordering Information**

Ordering Part Number	SEG	COM	Package Form	Reference	Remark
SSD1309Z	128	64	COG	Page 9	<ul style="list-style-type: none"> <li>○ Min SEG pad pitch : 37.5um</li> <li>○ Min COM pad pitch : 27um</li> <li>○ Min I/O pad pitch : 60 um</li> <li>○ Die thickness : 300 +/- 15 um</li> </ul>
SSD1309UR1	128	64	COF	Page 11,61	<ul style="list-style-type: none"> <li>○35mm film, 4 sprocket hole</li> <li>○Hot bar type COF</li> <li>○8-bit 80 / 8-bit 68 / SPI / I2C interface</li> <li>○SEG lead pitch 0.120mm x 0.998 =0.11976mm</li> <li>○COM lead pitch 0.120mm x 0.998 =0.11976mm</li> </ul>

## 7 PIN DESCRIPTION

Key:

I = Input	NC = Not Connected
O = Output	Pull LOW= connect to Ground
I/O = Bi-directional (input/output)	Pull HIGH= connect to $V_{DD}$
P = Power pin	

**Table 7-1 : SSD1309 Pin Description**

Pin Name	Pin Type	Description												
$V_{DD}$	P	Power supply pin for core logic operation.												
$V_{CC}$	P	Power supply for panel driving voltage. This is also the most positive power voltage supply pin.												
$V_{SS}$	P	Ground pin. It must be connected to external ground.												
$V_{LSS}$	P	Analog system ground pin. It must be connected to external ground.												
$V_{SS1}$	-	Reserved Pin. It must be connected to external ground.												
$V_{COMH}$	P	COM signal deselected voltage level. A capacitor should be connected between this pin and $V_{SS}$ .												
BS[2:0]	I	MCU bus interface selection pins. Select appropriate logic setting as described in the following table. BS2, BS1 and BS0 are pin select.  <table border="1" style="margin-left: auto; margin-right: auto;"> <caption><b>Table 7-2 : Bus Interface selection</b></caption> <thead> <tr> <th>BS[2:0]</th> <th>Interface</th> </tr> </thead> <tbody> <tr> <td>000</td> <td>4 line SPI</td> </tr> <tr> <td>001</td> <td>3 line SPI</td> </tr> <tr> <td>010</td> <td>I<sup>2</sup>C</td> </tr> <tr> <td>110</td> <td>8-bit 8080 parallel</td> </tr> <tr> <td>100</td> <td>8-bit 6800 parallel</td> </tr> </tbody> </table> <p><b>Note</b>  <sup>(1)</sup> 0 is connected to <math>V_{SS}</math>  <sup>(2)</sup> 1 is connected to <math>V_{DD}</math></p>	BS[2:0]	Interface	000	4 line SPI	001	3 line SPI	010	I <sup>2</sup> C	110	8-bit 8080 parallel	100	8-bit 6800 parallel
BS[2:0]	Interface													
000	4 line SPI													
001	3 line SPI													
010	I <sup>2</sup> C													
110	8-bit 8080 parallel													
100	8-bit 6800 parallel													
$I_{REF}$	I	This pin is the segment output current reference pin.  $I_{REF}$ is supplied externally. A resistor should be connected between this pin and $V_{SS}$ to maintain the current around 10uA. Please refer to Figure 8-15 for the details of resistor value												
CL	I	This is external clock input pin.  When internal clock is enabled (i.e. HIGH in CLS pin), this pin is not used and should be connected to $V_{SS}$ . When internal clock is disabled (i.e. LOW in CLS pin), this pin is the external clock source input pin.												
CLS	I	This is internal clock enable pin.  When it is pulled HIGH (i.e. connect to $V_{DD}$ ), internal clock is enabled. When it is pulled LOW, the internal clock is disabled; an external clock source must be connected to the CL pin for normal operation.												

Pin Name	Pin Type	Description
CS#	I	This pin is the chip select input connecting to the MCU. The chip is enabled for MCU communication only when CS# is pulled LOW (active LOW).
RES#	I	This pin is reset signal input. When the pin is pulled LOW, initialization of the chip is executed. Keep this pin pull HIGH during normal operation.
D/C#	I	This pin is Data/Command control pin connecting to the MCU.  When the pin is pulled HIGH, the data at D[7:0] will be interpreted as data. When the pin is pulled LOW, the data at D[7:0] will be transferred to a command register. In I <sup>2</sup> C mode, this pin acts as SA0 for slave address selection. When 3-wire serial interface is selected, this pin must be connected to V <sub>SS</sub> .  For detail relationship to MCU interface signals, refer to Timing Characteristics Diagrams Figure 13-1 to Figure 13-5
R/W# (WR#)	I	This pin is read / write control input pin connecting to the MCU interface.  When 6800 interface mode is selected, this pin will be used as Read/Write (R/W#) selection input. Read mode will be carried out when this pin is pulled HIGH and write mode when LOW. When 8080 interface mode is selected, this pin will be the Write (WR#) input. Data write operation is initiated when this pin is pulled LOW and the chip is selected.  When serial or I <sup>2</sup> C interface is selected, this pin must be connected to V <sub>SS</sub> .
E (RD#)	I	This pin is MCU interface input.  When 6800 interface mode is selected, this pin will be used as the Enable (E) signal. Read/write operation is initiated when this pin is pulled HIGH and the chip is selected. When 8080 interface mode is selected, this pin receives the Read (RD#) signal. Read operation is initiated when this pin is pulled LOW and the chip is selected.  When serial or I <sup>2</sup> C interface is selected, this pin must be connected to V <sub>SS</sub> .
D[7:0]	I/O	These pins are bi-directional data bus connecting to the MCU data bus.  Unused pins are recommended to tie LOW.  When serial interface mode is selected, D0 will be the serial clock input: SCLK; D1 will be the serial data input: SDIN and D2 should be kept NC. When I <sup>2</sup> C mode is selected, D2, D1 should be tied together and serve as SDA <sub>out</sub> , SDA <sub>in</sub> in application and D0 is the serial clock input, SCL.
SEG0 ~ SEG127	O	These pins provide the OLED segment driving signals. These pins are V <sub>SS</sub> state when display is OFF.
COM0 ~ COM63	O	These pins provide the Common switch signals to the OLED panel. These pins are in high impedance state when display is OFF.
TR[7:0]	-	Reserved pin and is recommended to keep it float.
NC	-	This is dummy pin. Do not group or short NC pins together.

## 8 FUNCTIONAL BLOCK DESCRIPTIONS

### 8.1 MCU Interface selection

SSD1309 MCU interface consist of 8 data pins and 5 control pins. The pin assignment at different interface mode is summarized in Table 8-1. Different MCU mode can be set by hardware selection on BS[2:0] pins (please refer to Table 7-2 for BS[2:0] setting).

**Table 8-1 : MCU interface assignment under different bus interface mode**

Pin Name Bus Interface	Data/Command Interface								Control Signal				
	D7	D6	D5	D4	D3	D2	D1	D0	E	R/W#	CS#	D/C#	RES#
8-bit 8080	D[7:0]								RD#	WR#	CS#	D/C#	RES#
8-bit 6800	D[7:0]								E	R/W#	CS#	D/C#	RES#
3-wire SPI	Tie LOW				NC	SDIN	SCLK	Tie LOW		CS#	Tie LOW	RES#	
4-wire SPI	Tie LOW				NC	SDIN	SCLK	Tie LOW		CS#	D/C#	RES#	
I <sup>2</sup> C	Tie LOW				SDA <sub>OUT</sub>	SDA <sub>IN</sub>	SCL	Tie LOW			SA0	RES#	

#### 8.1.1 MCU Parallel 6800-series Interface

The parallel interface consists of 8 bi-directional data pins (D[7:0]), R/W#, D/C#, E and CS#.

A LOW in R/W# indicates WRITE operation and HIGH in R/W# indicates READ operation.

A LOW in D/C# indicates COMMAND read/write and HIGH in D/C# indicates DATA read/write.

The E input serves as data latch signal while CS# is LOW. Data is latched at the falling edge of E signal.

**Table 8-2 : Control pins of 6800 interface**

Function	E	R/W#	CS#	D/C#
Write command	↓	L	L	L
Read status	↓	H	L	L
Write data	↓	L	L	H
Read data	↓	H	L	H

#### Note

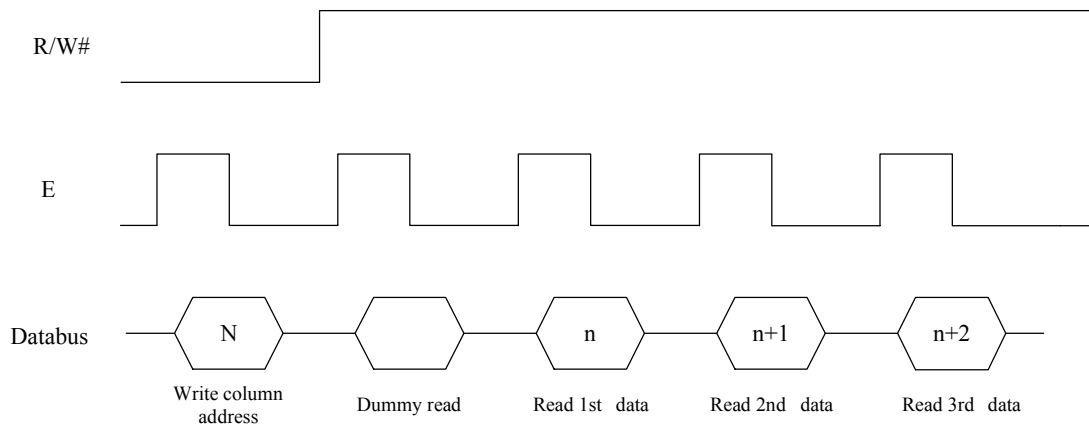

<sup>(1)</sup> ↓ stands for falling edge of signal

H stands for HIGH in signal

L stands for LOW in signal

In order to match the operating frequency of display RAM with that of the microprocessor, some pipeline processing is internally performed which requires the insertion of a dummy read before the first actual display data read. This is shown in Figure 8-1.

**Figure 8-1 : Data read back procedure - insertion of dummy read**

### 8.1.2 MCU Parallel 8080-series Interface

The parallel interface consists of 8 bi-directional data pins (D[7:0]), RD#, WR#, D/C# and CS#.

A LOW in D/C# indicates COMMAND read/write and HIGH in D/C# indicates DATA read/write.

A rising edge of RD# input serves as a data READ latch signal while CS# is kept LOW.

A rising edge of WR# input serves as a data/command WRITE latch signal while CS# is kept LOW.

**Figure 8-2 : Example of Write procedure in 8080 parallel interface mode**

**Figure 8-3 : Example of Read procedure in 8080 parallel interface mode**

**Table 8-3 : Control pins of 8080 interface**

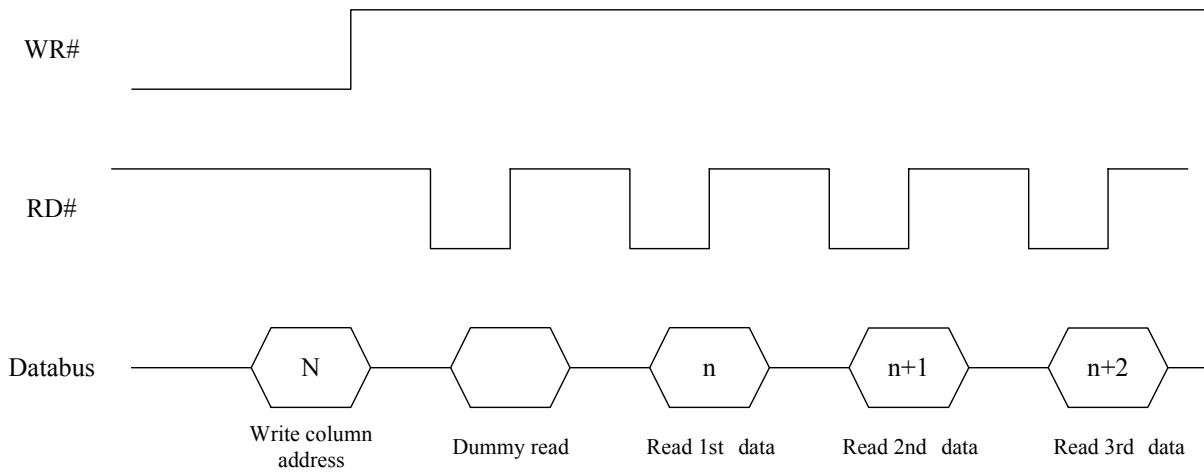

Function	RD#	WR#	CS#	D/C#
Write command	H	↑	L	L
Read status	↑	H	L	L
Write data	H	↑	L	H
Read data	↑	H	L	H

**Note**

- (1) ↑ stands for rising edge of signal
- (2) H stands for HIGH in signal
- (3) L stands for LOW in signal

In order to match the operating frequency of display RAM with that of the microprocessor, some pipeline processing is internally performed which requires the insertion of a dummy read before the first actual display data read. This is shown in Figure 8-4.

**Figure 8-4 : Display data read back procedure - insertion of dummy read**

**8.1.3 MCU Serial Interface (4-wire SPI)**

The 4-wire serial interface consists of serial clock: SCLK, serial data: SDIN, D/C#, CS#. In 4-wire SPI mode, D0 acts as SCLK, D1 acts as SDIN. For the unused data pins, D2 should be left open. The pins from D3 to D7, E and R/W# (WR#)# can be connected to an external ground.

**Table 8-4 : Control pins of 4-wire Serial interface**

Function	E	R/W#	CS#	D/C#	D0
Write command	Tie LOW	Tie LOW	L	L	↑
Write data	Tie LOW	Tie LOW	L	H	↑

**Note**

- (1) H stands for HIGH in signal
- (2) L stands for LOW in signal
- (3) ↑ stands for rising edge of signal

SDIN is shifted into an 8-bit shift register on every rising edge of SCLK in the order of D7, D6, ... D0. D/C# is sampled on every eighth clock and the data byte in the shift register is written to the Graphic Display Data RAM (GDDRAM) or command register in the same clock.

Under serial mode, only write operations are allowed.

**Figure 8-5 : Write procedure in 4-wire Serial interface mode**

### 8.1.4 MCU Serial Interface (3-wire SPI)

The 3-wire serial interface consists of serial clock SCLK, serial data SDIN and CS#.

In 3-wire SPI mode, D0 acts as SCLK, D1 acts as SDIN. For the unused data pins, D2 should be left open. The pins from D3 to D7, R/W# (WR#)#, E and D/C# can be connected to an external ground.

The operation is similar to 4-wire serial interface while D/C# pin is not used. There are altogether 9-bits will be shifted into the shift register on every ninth clock in sequence: D/C# bit, D7 to D0 bit. The D/C# bit (first bit of the sequential data) will determine the following data byte in the shift register is written to the Display Data RAM (D/C# bit = 1) or the command register (D/C# bit = 0).

Under serial mode, only write operations are allowed.

**Table 8-5 : Control pins of 3-wire Serial interface**

Function	E(RD#)	R/W#(WR#)	CS#	D/C#	D0	Note
Write command	Tie LOW	Tie LOW	L	Tie LOW	↑	(1) L stands for LOW in signal
Write data	Tie LOW	Tie LOW	L	Tie LOW	↑	(2) ↑ stands for rising edge of signal

**Figure 8-6 : Write procedure in 3-wire Serial interface mode**

### 8.1.5 MCU I<sup>2</sup>C Interface

The I<sup>2</sup>C communication interface consists of slave address bit SA0, I<sup>2</sup>C-bus data signal SDA (SDA<sub>OUT</sub>/D<sub>2</sub> for output and SDA<sub>IN</sub>/D<sub>1</sub> for input) and I<sup>2</sup>C-bus clock signal SCL (D<sub>0</sub>). Both the data and clock signals must be connected to pull-up resistors. RES# is used for the initialization of device.

a) Slave address bit (SA0)

SSD1309 has to recognize the slave address before transmitting or receiving any information by the I<sup>2</sup>C-bus. The device will respond to the slave address following by the slave address bit (“SA0” bit) and the read/write select bit (“R/W#” bit) with the following byte format,

b<sub>7</sub> b<sub>6</sub> b<sub>5</sub> b<sub>4</sub> b<sub>3</sub> b<sub>2</sub> b<sub>1</sub> b<sub>0</sub>  
0 1 1 1 1 0 SA0 R/W#

“SA0” bit provides an extension bit for the slave address. Either “0111100” or “0111101”, can be selected as the slave address of SSD1309. D/C# pin acts as SA0 for slave address selection.

“R/W#” bit is used to determine the operation mode of the I<sup>2</sup>C-bus interface. R/W#=1, it is in read mode. R/W#=0, it is in write mode.

b) I<sup>2</sup>C-bus data signal (SDA)

SDA acts as a communication channel between the transmitter and the receiver. The data and the acknowledgement are sent through the SDA.

It should be noticed that the ITO track resistance and the pulled-up resistance at “SDA” pin becomes a voltage potential divider. As a result, the acknowledgement would not be possible to attain a valid logic 0 level in “SDA”.

“SDA<sub>IN</sub>” and “SDA<sub>OUT</sub>” are tied together and serve as SDA. The “SDA<sub>IN</sub>” pin must be connected to act as SDA. The “SDA<sub>OUT</sub>” pin may be disconnected. When “SDA<sub>OUT</sub>” pin is disconnected, the acknowledgement signal will be ignored in the I<sup>2</sup>C-bus.

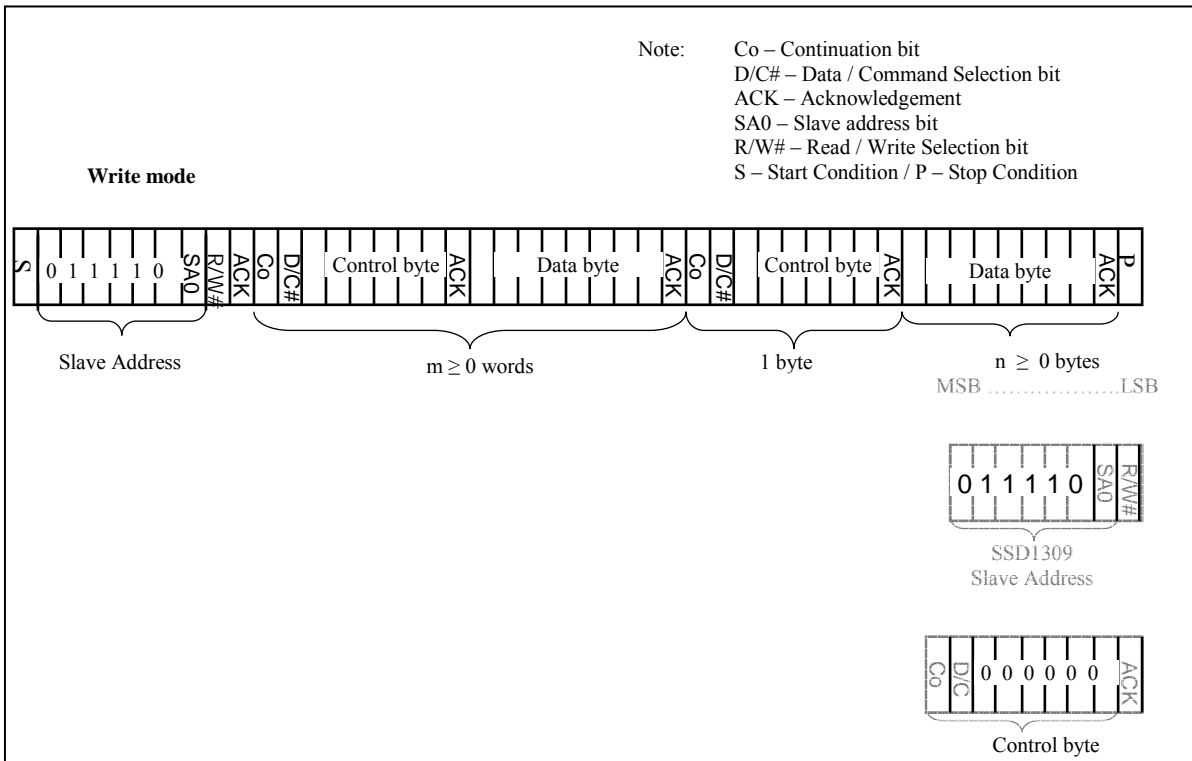

c) I<sup>2</sup>C-bus clock signal (SCL)

The transmission of information in the I<sup>2</sup>C-bus is following a clock signal, SCL. Each transmission of data bit is taken place during a single clock period of SCL.

### 8.1.5.1 I<sup>2</sup>C-bus Write data

The I<sup>2</sup>C-bus interface gives access to write data and command into the device. Please refer to Figure 8-7 for the write mode of I<sup>2</sup>C-bus in chronological order.

Figure 8-7 : I<sup>2</sup>C-bus data format

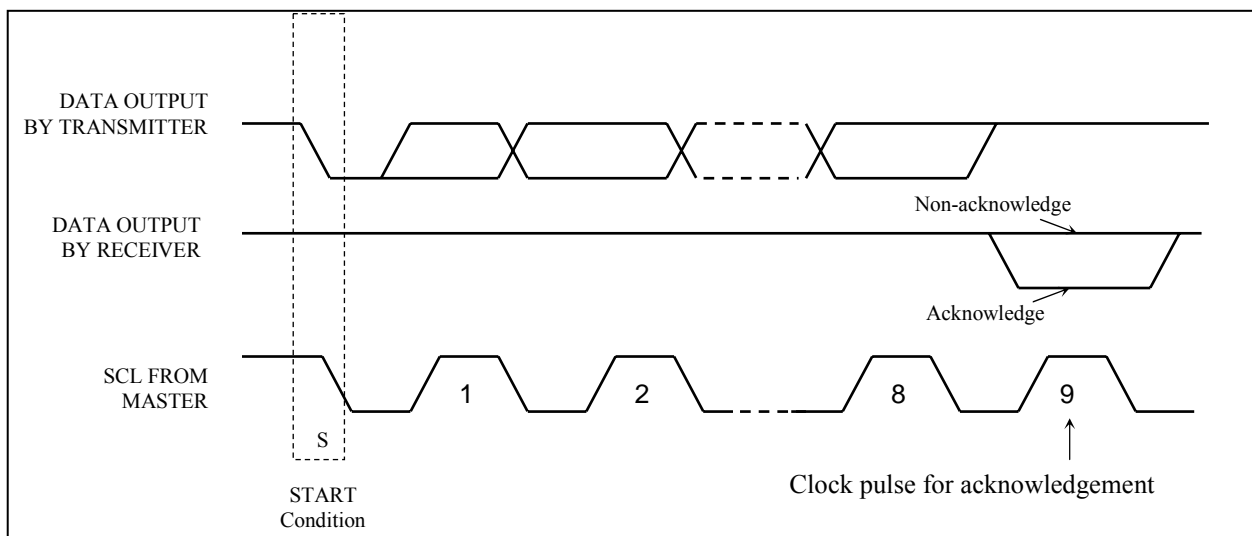

### 8.1.5.2 Write mode for I<sup>2</sup>C

- 1) The master device initiates the data communication by a start condition. The definition of the start condition is shown in Figure 8-8. The start condition is established by pulling the SDA from HIGH to LOW while the SCL stays HIGH.
- 2) The slave address is following the start condition for recognition use. For the SSD1309, the slave address is either “b0111100” or “b0111101” by changing the SA0 to LOW or HIGH (D/C pin acts as SA0).
- 3) The write mode is established by setting the R/W# bit to logic “0”.
- 4) An acknowledgement signal will be generated after receiving one byte of data, including the slave address and the R/W# bit. Please refer to the Figure 8-9 for the graphical representation of the acknowledge signal. The acknowledge bit is defined as the SDA line is pulled down during the HIGH period of the acknowledgement related clock pulse.
- 5) After the transmission of the slave address, either the control byte or the data byte may be sent across the SDA. A control byte mainly consists of Co and D/C# bits following by six “0” ‘s.
  - a. If the Co bit is set as logic “0”, the transmission of the following information will contain data bytes only.
  - b. The D/C# bit determines the next data byte is acted as a command or a data. If the D/C# bit is set to logic “0”, it defines the following data byte as a command. If the D/C# bit is set to logic “1”, it defines the following data byte as a data which will be stored at the GDDRAM. The GDDRAM column address pointer will be increased by one automatically after each data write.
- 6) Acknowledge bit will be generated after receiving each control byte or data byte.
- 7) The write mode will be finished when a stop condition is applied. The stop condition is also defined in Figure 8-8. The stop condition is established by pulling the “SDA in” from LOW to HIGH while the “SCL” stays HIGH.

**Figure 8-8 : Definition of the Start and Stop Condition**

**Figure 8-9 : Definition of the acknowledgement condition**

Please be noted that the transmission of the data bit has some limitations.

1. The data bit, which is transmitted during each SCL pulse, must keep at a stable state within the “HIGH” period of the clock pulse. Please refer to the Figure 8-10 for graphical representations. Except in start or stop conditions, the data line can be switched only when the SCL is LOW.
2. Both the data line (SDA) and the clock line (SCL) should be pulled up by external resistors.

**Figure 8-10 : Definition of the data transfer condition**

## 8.2 Command Decoder

This module determines whether the input data is interpreted as data or command. Data is interpreted based upon the input of the D/C# pin.

If D/C# pin is HIGH, D[7:0] is interpreted as display data written to Graphic Display Data RAM (GDDRAM). If it is LOW, the input at D[7:0] is interpreted as a command. Then data input will be decoded and written to the corresponding command register.

## 8.3 Oscillator Circuit and Display Time Generator

Figure 8-11 : Oscillator Circuit and Display Time Generator

This module is an on-chip LOW power RC oscillator circuitry. The operation clock (CLK) can be generated either from internal oscillator or external source CL pin. This selection is done by CLS pin. If CLS pin is pulled HIGH, internal oscillator is chosen and CL should be connected to V<sub>SS</sub>. Pulling CLS pin LOW disables internal oscillator and external clock must be connected to CL pins for proper operation. When the internal oscillator is selected, its output frequency F<sub>osc</sub> can be changed by command D5h A[7:4].

The display clock (DCLK) for the Display Timing Generator is derived from CLK. The division factor “D” can be programmed from 1 to 16 by command D5h

$$DCLK = F_{OSC} / D$$

The frame frequency of display is determined by the following formula.

$$F_{FRM} = \frac{F_{osc}}{D \times K \times \text{No. of Mux}}$$

where

- D stands for clock divide ratio. It is set by command D5h A[3:0]. The divide ratio has the range from 1 to 16.
- K is the number of display clocks per row. The value is derived by  
 $K = \text{Phase 1 period} + \text{Phase 2 period} + K_o$   
 $= 2 + 2 + 65 = 69$  at power on reset (that is K<sub>o</sub> is a constant that equals to 65)  
 (Please refer to Section 8.5 “Segment Drivers / Common Drivers” for the details of the “Phase”)
- Number of multiplex ratio is set by command A8h. The power on reset value is 63 (i.e. 64MUX).
- F<sub>OSC</sub> is the oscillator frequency. It can be changed by command D5h A[7:4]. The higher the register setting results in higher frequency.

## 8.4 Reset Circuit

When RES# input is LOW, the chip is initialized with the following status:

1. Display is OFF
2. 128 x 64 Display Mode
3. Normal segment and display data column address and row address mapping (SEG0 mapped to address 00h and COM0 mapped to address 00h)
4. Shift register data clear in serial interface
5. Display start line is set at display RAM address 0
6. Column address counter is set at 0
7. Normal scan direction of the COM outputs
8. Contrast control register is set at 7Fh
9. Normal display mode (Equivalent to A4h command)

## 8.5 Segment Drivers / Common Drivers

Segment drivers deliver 128 current sources to drive the OLED panel. The driving current can be adjusted from 0 to 320uA with 256 steps. Common drivers generate voltage-scanning pulses.

The segment driving waveform is divided into three phases:

1. In phase 1, the OLED pixel charges of previous image are discharged in order to prepare for next image content display.
2. In phase 2, the OLED pixel is driven to the targeted voltage. The pixel is driven to attain the corresponding voltage level from  $V_{SS}$ . The period of phase 2 can be programmed in length from 1 to 15 DCLKs. If the capacitance value of the pixel of OLED panel is larger, a longer period is required to charge up the capacitor to reach the desired voltage.
3. In phase 3, the OLED driver switches to use current source to drive the OLED pixels and this is the current drive stage.

**Figure 8-12 : Segment Output Waveform in three phases**

After finishing phase 3, the driver IC will go back to phase 1 to display the next row image data. This three-step cycle is run continuously to refresh image display on OLED panel.

In phase 3, if the length of current drive pulse width is set to 65, after finishing 65 DCLKs in current drive phase, the driver IC will go back to phase 1 for next row display.

### 8.6 Graphic Display Data RAM (GDDRAM)

The GDDRAM is a bit mapped static RAM holding the bit pattern to be displayed. The size of the RAM is 128 x 64 bits and the RAM is divided into eight pages, from PAGE0 to PAGE7, which are used for monochrome 128x64 dot matrix display, as shown in Figure 8-13.

**Figure 8-13 : GDDRAM pages structure of SSD1309**

		Row re-mapping
PAGE0 (COM0-COM7)	Page 0	PAGE0 (COM 63-COM56)
PAGE1 (COM8-COM15)	Page 1	PAGE1 (COM 55-COM48)
PAGE2 (COM16-COM23)	Page 2	PAGE2 (COM47-COM40)
PAGE3 (COM24-COM31)	Page 3	PAGE3 (COM39-COM32)
PAGE4 (COM32-COM39)	Page 4	PAGE4 (COM31-COM24)
PAGE5 (COM40-COM47)	Page 5	PAGE5 (COM23-COM16)
PAGE6 (COM48-COM55)	Page 6	PAGE6 (COM15-COM8)
PAGE7 (COM56-COM63)	Page 7	PAGE7 (COM 7-COM0)
	SEG0 -----SEG127	
Column re-mapping	SEG127 -----SEG0	

When one data byte is written into GDDRAM, all the rows image data of the same page of the current column are filled (i.e. the whole column (8 bits) pointed by the column address pointer is filled.). Data bit D0 is written into the top row, while data bit D7 is written into bottom row as shown in Figure 8-14.

**Figure 8-14 : Enlargement of GDDRAM (No row re-mapping and column-remapping)**

For mechanical flexibility, re-mapping on both Segment and Common outputs can be selected by software as shown in Figure 8-13.

For vertical shifting of the display, an internal register storing the display start line can be set to control the portion of the RAM data to be mapped to the display (command D3h).

## 8.7 SEG/COM Driving block

This block is used to derive the incoming power sources into the different levels of internal use voltage and current.

- $V_{CC}$  is the most positive voltage supply.
- $V_{COMH}$  is the Common deselected level. It is internally regulated.
- $V_{LSS}$  is the ground path of the analog and panel current.
- $I_{REF}$  is a reference current source for segment current drivers  $I_{SEG}$ . The relationship between reference current and segment current of a color is:

$$I_{SEG} = (\text{Contrast}+1) / 8 \times I_{REF}$$

in which the contrast (0~255) is set by Set Contrast command 81h

The magnitude of  $I_{REF}$  is controlled by the value of resistor, which is connected between  $I_{REF}$  pin and  $V_{SS}$  as shown in Figure 8-15. It is recommended to set  $I_{REF}$  to  $10 \pm 2\mu\text{A}$  so as to achieve  $I_{SEG} = 320\mu\text{A}$  at maximum contrast 255.

**Figure 8-15 :  $I_{REF}$  Current Setting by Resistor Value**

Since the voltage at  $I_{REF}$  pin is  $V_{CC} - 3V$ , the value of resistor R1 can be found as below:

For  $I_{REF} = 10\mu\text{A}$ ,  $V_{CC} = 12V$ :

$$\begin{aligned} R1 &= (\text{Voltage at } I_{REF} - V_{SS}) / I_{REF} \\ &\approx (12 - 3) / 10\mu\text{A} \\ &= 900\text{k}\Omega \end{aligned}$$

### 8.8 Power ON and OFF sequence

The following figures illustrate the recommended power ON and power OFF sequence of SSD1309

*Power ON sequence:*

1. Power ON  $V_{DD}$
2. After  $V_{DD}$  become stable, set RES# pin LOW (logic low) for at least 3us ( $t_1$ )<sup>(3)</sup> and then HIGH (logic high).
3. After set RES# pin LOW (logic low), wait for at least 3us ( $t_2$ ). Then Power ON  $V_{CC}$ .<sup>(1)</sup>
4. After  $V_{CC}$  become stable, send command AFh for display ON. SEG/COM will be ON after 100ms ( $t_{AF}$ ).

**Figure 8-16 : The Power ON sequence**

*Power OFF sequence:*

1. Send command AEh for display OFF.
2. Power OFF  $V_{CC}$ .<sup>(1),(2)</sup>
3. Power OFF  $V_{DD}$  after  $t_{OFF}$ .<sup>(4)</sup> (where Minimum  $t_{OFF}$ =0ms, typical  $t_{OFF}$ =100ms)

**Figure 8-17 : The Power OFF sequence**

**Note:**

- <sup>(1)</sup>  $V_{CC}$  should be kept float (i.e. disable) when it is OFF.
- <sup>(2)</sup> Power Pins ( $V_{DD}$ ,  $V_{CC}$ ) can never be pulled to ground under any circumstance.
- <sup>(3)</sup> The register values are reset after  $t_1$ .
- <sup>(4)</sup>  $V_{DD}$  should not be Power OFF before  $V_{CC}$  Power OFF.

## 9 Command Table

(D/C#=0, R/W#(WR#) = 0, E(RD#=1) unless specific setting is stated)

### 9.1 Fundamental Command Table

Table 9-1: Fundamental Command Table

1. Fundamental Command Table											
D/C#	Hex	D7	D6	D5	D4	D3	D2	D1	D0	Command	Description
0 0	81 A[7:0]	1 A <sub>7</sub>	0 A <sub>6</sub>	0 A <sub>5</sub>	0 A <sub>4</sub>	0 A <sub>3</sub>	0 A <sub>2</sub>	0 A <sub>1</sub>	1 A <sub>0</sub>	Set Contrast Control	Double byte command to select 1 out of 256 contrast steps. Contrast increases as the value increases. (RESET = 7Fh)
0	A4/A5	1	0	1	0	0	1	0	X <sub>0</sub>	Entire Display ON	A4h, X <sub>0</sub> =0b: Resume to RAM content display (RESET) Output follows RAM content  A5h, X <sub>0</sub> =1b: Entire display ON Output ignores RAM content

### Note

(2) "\*" stands for "Don't care".

**Table 9-6 : Read Command Table**

Bit Pattern	Command	Description
D <sub>7</sub> D <sub>6</sub> D <sub>5</sub> D <sub>4</sub> D <sub>3</sub> D <sub>2</sub> D <sub>1</sub> D <sub>0</sub>	Status Register Read	D[7] : Reserved D[6] : “1” for display OFF / “0” for display ON D[5] : Reserved D[4] : Reserved D[3] : Reserved D[2] : Reserved D[1] : Reserved D[0] : Reserved

**Note**

<sup>(1)</sup> Patterns other than those given in the Command Table are prohibited to enter the chip as a command; as unexpected results can occur.

**9.6 Data Read / Write**

To read data from the GDDRAM, select HIGH for both the R/W# (WR#) pin and the D/C# pin for 6800-series parallel mode and select LOW for the E (RD#) pin and HIGH for the D/C# pin for 8080-series parallel mode. No data read is provided in serial mode operation.

In normal data read mode the GDDRAM column address pointer will be increased automatically by one after each data read.

Also, a dummy read is required before the first data read.

To write data to the GDDRAM, select LOW for the R/W# (WR#) pin and HIGH for the D/C# pin for both 6800-series parallel mode and 8080-series parallel mode. The serial interface mode is always in write mode. The GDDRAM column address pointer will be increased automatically by one after each data write.

**Table 9-7 : Address increment table (Automatic)**

D/C#	R/W# (WR#)	Comment	Address Increment
0	0	Write Command	No
0	1	Read Status	No
1	0	Write Data	Yes
1	1	Read Data	Yes

## 10 COMMAND DESCRIPTIONS

### 10.1 Set Lower Column Start Address for Page Addressing Mode (00h~0Fh)

This command specifies the lower nibble of the 8-bit column start address for the display data RAM under Page Addressing Mode. The column address will be incremented by each data access. Refer to Section 9.3 and Section 10.3 for details.

### 10.2 Set Higher Column Start Address for Page Addressing Mode (10h~1Fh)

This command specifies the higher nibble of the 8-bit column start address for the display data RAM under Page Addressing Mode. The column address will be incremented by each data access. Refer to Section 9.3 and Section 10.3 for details.

### 10.3 Set Memory Addressing Mode (20h)

There are 3 different memory addressing mode in SSD1309: page addressing mode, horizontal addressing mode and vertical addressing mode. This command sets the way of memory addressing into one of the above three modes. In there, "COL" means the graphic display data RAM column.

#### Page addressing mode (A[1:0]=10xb)

In page addressing mode, after the display RAM is read / written, the column address pointer is increased automatically by 1. If the column address pointer reaches column end address, the column address pointer is reset to column start address and page address pointer is not changed. Users have to set the new page and column addresses in order to access the next page RAM content. The sequence of movement of the PAGE and column address point for page addressing mode is shown in Figure 10-1.

Figure 10-1 : Address Pointer Movement of Page addressing mode

	COL0	COL 1	.....	COL 126	COL 127
PAGE0	→				
PAGE1	→				
:	→				
PAGE6	→				
PAGE7	→				

In normal display data RAM read or write and page addressing mode, the following steps are required to define the starting RAM access pointer location:

- Set the page start address of the target display location by command B0h to B7h.
- Set the lower start column address of pointer by command 00h~0Fh.
- Set the upper start column address of pointer by command 10h~1Fh.

For example, if the page address is set to B2h, lower column address is 03h and upper column address is 10h, then that means the starting column is SEG3 of PAGE2. The RAM access pointer is located as shown in Figure 10-2. The input data byte will be written into RAM position of column 3.

Figure 10-2 : Example of GDDRAM access pointer setting in Page Addressing Mode (No row and column-remapping)

Horizontal addressing mode (A[1:0]=00b)

In horizontal addressing mode, after the display RAM is read / written, the column address pointer is increased automatically by 1. If the column address pointer reaches column end address, the column address pointer is reset to column start address and page address pointer is increased by 1. The sequence of movement of the page and column address point for horizontal addressing mode is shown in Figure 10-3. When both column and page address pointers reach the end address, the pointers are reset to column start address and page start address (Dotted line in Figure 10-3.)

**Figure 10-3 : Address Pointer Movement of Horizontal addressing mode**

Vertical addressing mode: (A[1:0]=01b)

In vertical addressing mode, after the display RAM is read / written, the page address pointer is increased automatically by 1. If the page address pointer reaches the page end address, the page address pointer is reset to page start address and column address pointer is increased by 1. The sequence of movement of the page and column address point for vertical addressing mode is shown in Figure 10-4. When both column and page address pointers reach the end address, the pointers are reset to column start address and page start address (Dotted line in Figure 10-4.)

**Figure 10-4 : Address Pointer Movement of Vertical addressing mode**

In normal display data RAM read or write and horizontal / vertical addressing mode, the following steps are required to define the RAM access pointer location:

- Set the column start and end address of the target display location by command 21h.
- Set the page start and end address of the target display location by command 22h.

Example is shown in Figure 10-5.

**10.4 Set Column Address (21h)**

This triple byte command specifies column start address and end address of the display data RAM. This command also sets the column address pointer to column start address. This pointer is used to define the current read/write column address in graphic display data RAM. If horizontal address increment mode is enabled by command 20h, after finishing read/write one column data, it is incremented automatically to the next column address. Whenever the column address pointer finishes accessing the end column address, it is reset back to start column address and the row address is incremented to the next row.

### 10.5 Set Page Address (22h)

This triple byte command specifies page start address and end address of the display data RAM. This command also sets the page address pointer to page start address. This pointer is used to define the current read/write page address in graphic display data RAM. If vertical address increment mode is enabled by command 20h, after finishing read/write one page data, it is incremented automatically to the next page address. Whenever the page address pointer finishes accessing the end page address, it is reset back to start page address.

The figure below shows the way of column and page address pointer movement through the example: column start address is set to 2 and column end address is set to 97, page start address is set to 1 and page end address is set to 2; Horizontal address increment mode is enabled by command 20h. In this case, the graphic display data RAM column accessible range is from column 2 to column 97 and from page 1 to page 2 only. In addition, the column address pointer is set to 2 and page address pointer is set to 1. After finishing read/write one pixel of data, the column address is increased automatically by 1 to access the next RAM location for next read/write operation (*solid line in Figure 10-5*). Whenever the column address pointer finishes accessing the end column 97, it is reset back to column 2 and page address is automatically increased by 1 (*solid line in Figure 10-5*). While the end page 2 and end column 97 RAM location is accessed, the page address is reset back to 1 and the column address is reset back to 2 (*dotted line in Figure 10-5*). .

**Figure 10-5: Example of Column and Row Address Pointer Movement (LS pin pulled LOW)**

### 10.6 Set Display Start Line (40h~7Fh)

This command sets the Display Start Line register to determine starting address of display RAM, by selecting a value from 0 to 63. With value equal to 0, RAM row 0 is mapped to COM0. With value equal to 1, RAM row 1 is mapped to COM0 and so on. Refer to Table 10-1 for more illustrations.

### 10.7 Set Contrast Control for BANK0 (81h)

This command sets the Contrast Setting of the display. The chip has 256 contrast steps from 00h to FFh. The segment output current increases as the contrast step value increases.

### 10.8 Set Segment Re-map (A0h/A1h)

This command changes the mapping between the display data column address and the segment driver. It allows flexibility in OLED module design. Refer to Section 9.4.

This command only affects subsequent data input. Data already stored in GDDRAM will have no changes.

### 10.9 Entire Display ON (A4h/A5h)

A4h command enable display outputs according to the GDDRAM contents.

If A5h command is issued, then by using A4h command, the display will resume to the GDDRAM contents.

In other words, A4h command resumes the display from entire display “ON” stage.

A5h command forces the entire display to be “ON”, regardless of the contents of the display data RAM.

### 10.10 Set Normal/Inverse Display (A6h/A7h)

This command sets the display to be either normal or inverse. In normal display a RAM data of 1 indicates an “ON” pixel while in inverse display a RAM data of 0 indicates an “ON” pixel.

### 10.11 Set Multiplex Ratio (A8h)

This command switches the default 64 multiplex mode to any multiplex ratio, ranging from 16 to 64. The output pads COM0~COM63 will be switched to the corresponding COM signal.

### 10.12 Set Display ON/OFF (AEh/AFh)

These single byte commands are used to turn the OLED panel display ON or OFF.

When the display is ON, the selected circuits by Set Master Configuration command will be turned ON.

When the display is OFF, those circuits will be turned OFF and the segment and common output are in  $V_{SS}$  state and high impedance state, respectively. These commands set the display to one of the two states:

- AEh : Display OFF
- AFh : Display ON

**Figure 10-6 : Transition between different modes**

### 10.13 Set Page Start Address for Page Addressing Mode (B0h~B7h)

This command positions the page start address from 0 to 7 in GDDRAM under Page Addressing Mode. Refer to Section 10.3 for details.

### 10.14 Set COM Output Scan Direction (C0h/C8h)

This command sets the scan direction of the COM output, allowing layout flexibility in the OLED module design. Additionally, the display will show once this command is issued. For example, if this command is sent during normal display then the graphic display will be vertically flipped immediately. Please refer to Table 10-3 for details.

### 10.15 Set Display Offset (D3h)

This is a double byte command. The second command specifies the mapping of the display start line to one of COM0~COM63 (assuming that COM0 is the display start line then the display start line register is equal to 0).

For example, to move the COM16 towards the COM0 direction by 16 lines the 6-bit data in the second byte should be given as 010000b. To move in the opposite direction by 16 lines the 6-bit data should be given by  $64 - 16$ , so the second byte would be 100000b. The following two tables (Table 10-1, Table 10-2) show the examples of setting the command C0h/C8h and D3h.

**Table 10-1: Example of Set Display Offset and Display Start Line without Remap**

Hardware pin name	Output												Set MUX ration (A8h) COM normal / remap (C0h / C8h) Display offset (D3h) Display start line (40h - 7Fh)

### 10.16 Set Display Clock Divide Ratio/ Oscillator Frequency (D5h)

This command consists of two functions:

- Display Clock Divide Ratio (D) (A[3:0])  
Set the divide ratio to generate DCLK (Display Clock) from CLK. The divide ratio is from 1 to 16, with reset value = 0000b. Please refer to section 8.3 for the details relationship of DCLK and CLK.
- Oscillator Frequency (A[7:4])  
Program the oscillator frequency Fosc that is the source of CLK if CLS pin is pulled high. The 4-bit value results in 16 different frequency settings available as shown below. The default setting is 1000b.

### 10.17 Set Pre-charge Period (D9h)

This command is used to set the duration of the pre-charge period. The interval is counted in number of DCLK, where RESET equals to 2 DCLKs.

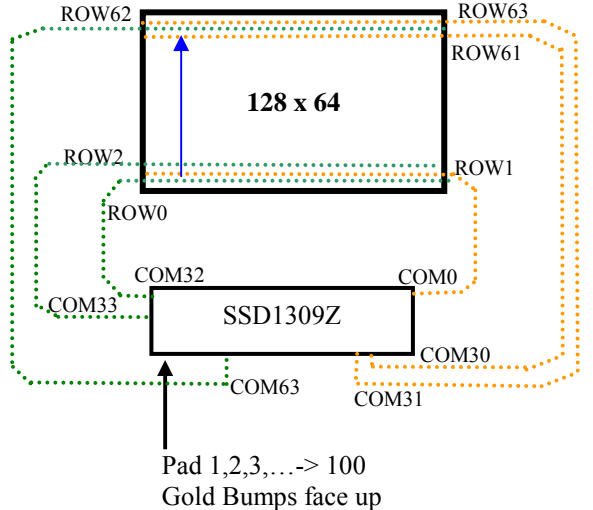

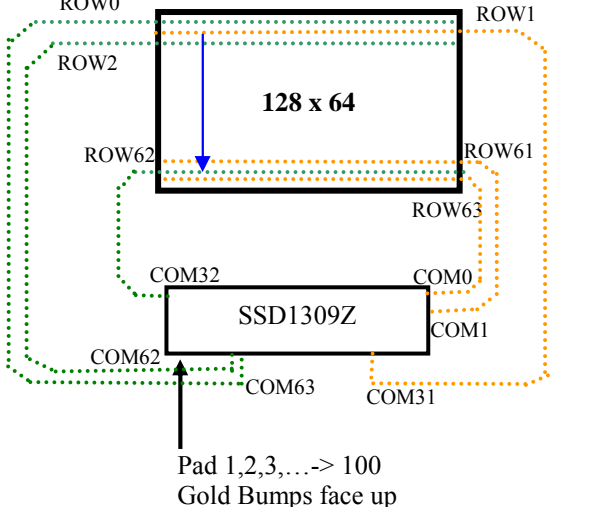

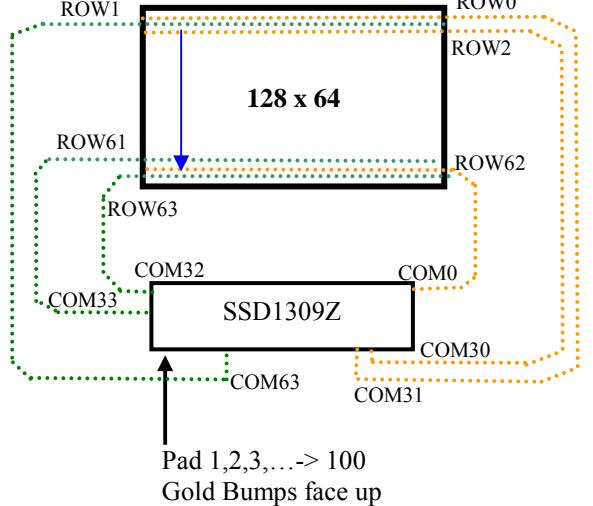

### 10.18 Set COM Pins Hardware Configuration (DAh)

This command sets the COM signals pin configuration to match the OLED panel hardware layout. The table below shows the COM pin configuration under different conditions (for MUX ratio =64):

**Table 10-3 : COM Pins Hardware Configuration**

Conditions	COM pins Configurations
1 Sequential COM pin configuration (DAh A[4] =0) COM output Scan direction: from COM0 to COM63 (C0h) Disable COM Left/Right remap (DAh A[5] =0)	<p>SSD1309Z</p> <p>Pad 1,2,3,...-&gt;100 Gold Bumps face up</p>
2 Sequential COM pin configuration (DAh A[4] =0) COM output Scan direction: from COM0 to COM63 (C0h) Enable COM Left/Right remap (DAh A[5] =1)	<p>SSD1309Z</p> <p>Pad 1,2,3,...-&gt; 100 Gold Bumps face up</p>

Conditions	COM pins Configurations
3 Sequential COM pin configuration (DAh A[4] =0) COM output Scan direction: from COM63 to COM0 (C8h) Disable COM Left/Right remap (DAh A[5] =0)	<p>Pad 1,2,3,...-&gt; 100 Gold Bumps face up</p>
4 Sequential COM pin configuration (DAh A[4] =0) COM output Scan direction: from COM63 to COM0 (C8h) Enable COM Left/Right remap (DAh A[5] =1)	<p>Pad 1,2,3,...-&gt; 100 Gold Bumps face up</p>
5 Alternative COM pin configuration (DAh A[4] =1) COM output Scan direction: from COM0 to COM63 (C0h) Disable COM Left/Right remap (DAh A[5] =0)	<p>Pad 1,2,3,...-&gt; 100 Gold Bumps face up</p>

Conditions	COM pins Configurations
<p>6 Alternative COM pin configuration (DAh A[4] =1)  COM output Scan direction: from COM0 to COM63 (C0h)  Enable COM Left/Right remap (DAh A[5] =1)</p>	 <p>Pad 1,2,3,...-&gt; 100 Gold Bumps face up</p>
<p>7 Alternative COM pin configuration (DAh A[4] =1)  COM output Scan direction: from COM63 to COM0(C8h)  Disable COM Left/Right remap (DAh A[5] =0)</p>	 <p>Pad 1,2,3,...-&gt; 100 Gold Bumps face up</p>
<p>8 Alternative COM pin configuration (DAh A[4] =1)  COM output Scan direction: from COM63 to COM0(C8h)  Enable COM Left/Right remap (DAh A[5] =1)</p>	 <p>Pad 1,2,3,...-&gt; 100 Gold Bumps face up</p>

### 10.19 Set V<sub>COMH</sub> Deselect Level (DBh)

This command adjusts the V<sub>COMH</sub> regulator output.

### 10.20 Set GPIO (DCh)

This double byte command is used to set the state of GPIO pin. Refer to Table 9-4 for details.

### 10.21 NOP (E3h)

No Operation Command.

### 10.22 Set Command Lock (FDh)

This double byte command is used to lock the OLED driver IC from accepting any command except itself. After entering FDh 16h (A[2]=1b), the OLED driver IC will not respond to any newly-entered command (except FDh 12h A[2]=0b) and there will be no memory access. This is called “Lock” state. That means the OLED driver IC ignore all the commands (except FDh 12h A[2]=0b) during the “Lock” state.

Entering FDh 12h (A[2]=0b) can unlock the OLED driver IC. That means the driver IC resumes from the “Lock” state, and the driver IC will then respond to the command and memory access.

### 10.23 Horizontal Scroll Setup (26h/27h)

This command consists of seven consecutive bytes to set up the horizontal scroll parameters and determines the scrolling start page, end page, scrolling speed, start column and end column; refer to Table 9-2 for details.

Before issuing this command the horizontal scroll must be deactivated (2Eh). Otherwise, RAM content may be corrupted.

The SSD1309 horizontal scroll is designed for 128 columns scrolling. The following two figures (Figure 10-7, Figure 10-8, and Figure 10-9) show the examples of using the horizontal scroll:

**Figure 10-7: Horizontal scroll example: Scroll RIGHT by 1 column**

Original Setting	SEG0	SEG1	SEG2	SEG3	SEG4	SEG5	...	...	...	SEG122	SEG123	SEG124	SEG125	SEG126	SEG127
After one scroll step	SEG127	SEG0	SEG1	SEG2	SEG3	SEG4	...	...	...	SEG121	SEG122	SEG123	SEG124	SEG125	SEG126

**Figure 10-8: Horizontal scroll example: Scroll LEFT by 1 column**

Original Setting	SEG0	SEG1	SEG2	SEG3	SEG4	SEG5	...	...	...	SEG122	SEG123	SEG124	SEG125	SEG126	SEG127
After one scroll step	SEG1	SEG2	SEG3	SEG4	SEG5	SEG6	...	...	...	SEG123	SEG124	SEG125	SEG126	SEG127	SEG0

**Figure 10-9: Horizontal scrolling setup example (LS pin pull LOW)**

## 10.24 Continuous Vertical and Horizontal Scroll Setup (29h/2Ah)

This command consists of seven consecutive bytes to set up the continuous vertical scroll parameters and determine the scrolling start page, end page, scrolling speed and vertical scrolling offset; refer to Table 9-2 for details.

If the vertical scrolling offset byte E[5:0] of command 29h / 2Ah is set to zero, then only horizontal scrolling is performed (like command 26/27h). On the other hand, if the number of column scroll offset byte A[0] is set to zero, then only vertical scrolling is performed.

Continuous diagonal (horizontal + vertical) scrolling would be enabled if both A[0] and E[5:0] are set to be non-zero, whereas full column diagonal scrolling mode is suggested by setting F[7:0]=00h and G[7:0]=7Fh.

Before issuing this command the scroll must be deactivated (2Eh), or otherwise, RAM content may be corrupted. The following figures (Figure 10-10 and Figure 10-11) show the examples of using the continuous vertical scroll and the continuous diagonal scroll, respectively.

Figure 10-10: Continuous Vertical scrolling setup example (LS pin pull LOW)

**Figure 10-11: Continuous Vertical and Horizontal scrolling setup example (LS pin pull LOW)**

### 10.25 Deactivate Scroll (2Eh)

This command stops the motion of scrolling. After sending 2Eh command to deactivate the scrolling action, the ram data needs to be rewritten.

### 10.26 Activate Scroll (2Fh)

This command starts the motion of scrolling and should only be issued after the scroll setup parameters have been defined by the scrolling setup commands: 26h / 27h / 29h / 2Ah. The setting in the latest scrolling setup command overwrites the setting in the previous scrolling setup command.

The following actions are prohibited after the scrolling is activated

1. RAM access (Data write or read)
2. Changing the horizontal scroll setup parameters

### 10.27 Set Vertical Scroll Area (A3h)

This command consists of 3 consecutive bytes to set up the vertical scroll area. For the continuous vertical scroll function (command 29h / 2Ah), the number of rows in the vertical scroll area can be set smaller than or equating to the MUX ratio. Figure 10-10 shows a vertical scrolling example with different settings in vertical scroll area.

### 10.28 Content Scroll Setup (2Ch/2Dh)

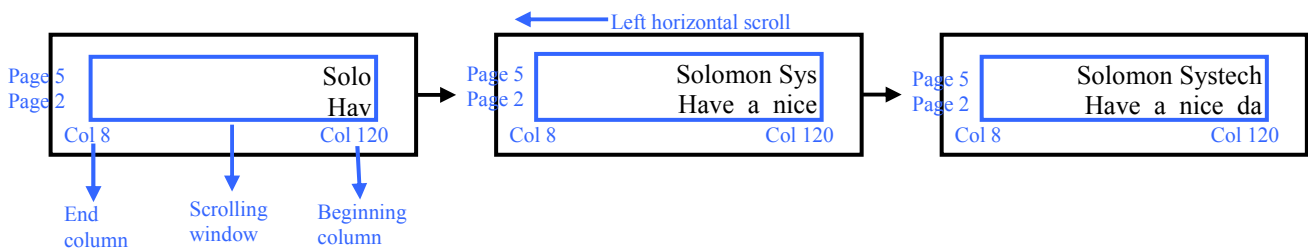

This command consists of seven consecutive bytes to set up the horizontal scroll parameters and determine the scrolling start page, end page, start column and end column. One column will be scrolled horizontally by sending the setting of command 2Ch / 2Dh once.

When command 2Ch / 2Dh are sent consecutively, a delay time of  $\frac{2}{FrameFreq}$  must be set.

Figure 10-12 shown an example of using 2Dh “Content Scroll Setup” command for horizontal scrolling to left with infinite content update. In there, “Col” means the graphic display data RAM column.

**Figure 10-12: Content Scrolling example (2Dh, Left Horizontal Scroll by one column)**

By using command 2Ch/2Dh, RAM contents are scrolled and updated by one column. Table 10-4 is an example of content scrolling setting of SSD1309 (scrolling window of 4 pages). The values of registers depend on different conditions and applications.

**Table 10-4 : Content Scrolling software flow example (Page addressing mode – command 20h, 02h)**

Step	Action	D/C#	Code	Remarks
1	<b>For i= 1 to n</b>	-	-	Create “For loop” for infinite content scrolling
2	Set Content scrolling command (scrolling window : Page 2 to 5, Col 8 to Col 120)	0	2Dh	Left Horizontal Scroll by one column
0		00h	A[7:0] : Dummy byte (Set as 00h)	
0		02h	B[2:0] : Define start page address	
0		01h	C[7:0] : Dummy byte (Set as 01h)	
0		05h	D[2:0] : Define end page address	
0		00h	E[7:0] : Dummy byte (Set as 00h)	
0		08h	F[6:0] : Define start column address	
0		78h	G[6:0] : Define end column address	
3	Add Delay time of $2/FrameFreq$	-	-	E.g. Delay 20ms if frame freq $\approx$ 100Hz
4	Write RAM on the beginning column of the scrolling window			
	Write RAM on (Page2, Col 120) <i>(Content update in beginning column)</i>	0	B2h	Set Page Start Address for Page Addressing Mode
		0	17h	Set Higher Column Start Address for Page Addressing Mode
		0	08h	Set Lower Column Start Address for Page Addressing Mode
		1	-	Write data to fill the RAM
	Write RAM on (Page3, Col 120) <i>(Content update in beginning column)</i>	0	B3h	Set Page Start Address for Page Addressing Mode
		0	17h	Set Higher Column Start Address for Page Addressing Mode
		0	08h	Set Lower Column Start Address for Page Addressing Mode
		1	-	Write data to fill the RAM
	Write RAM on (Page4, Col 120) <i>(Content update in beginning column)</i>	0	B4h	Set Page Start Address for Page Addressing Mode
		0	17h	Set Higher Column Start Address for Page Addressing Mode
		0	08h	Set Lower Column Start Address for Page Addressing Mode
		1	-	Write data to fill the RAM
	Write RAM on (Page5, Col 120) <i>(Content update in beginning column)</i>	0	B5h	Set Page Start Address for Page Addressing Mode
		0	17h	Set Higher Column Start Address for Page Addressing Mode
		0	08h	Set Lower Column Start Address for Page Addressing Mode
		1	-	Write data to fill the RAM
5	<b>i=i+1</b>	-	-	Go to next “For loop”
	<b>Delay timing</b>	-	-	Set time interval between each scroll step if necessary
	<b>End</b>			

There are 3 different memory addressing mode in SSD1309: page addressing mode, horizontal addressing mode and vertical addressing mode and it is selected by command 20h. Table 10-4 is an example of content scrolling software flow under page addressing mode, while vertical addressing mode example is shown in below Table 10-5.

**Table 10-5 : Content Scrolling setting example (Vertical addressing mode – command 20h, 01h)**

Step	Action	D/C#	Code	Remarks
1	<b>For i= 1 to n</b>	-	-	Create “For loop” for infinite content scrolling
2	Set Content scrolling command (scrolling window : Page 2 to 5, Col 8 to Col 120)	0	2Dh	Left Horizontal Scroll by one column
		0	00h	A[7:0] : Dummy byte (Set as 00h)
		0	02h	B[2:0] : Define start page address
		0	01h	C[7:0] : Dummy byte (Set as 01h)
		0	05h	D[2:0] : Define end page address
		0	00h	E[7:0] : Dummy byte (Set as 00h)
		0	08h	F[6:0] : Define start column address
		0	78h	G[6:0] : Define end column address
3	Add Delay time of $2/FrameFreq$	-	-	E.g. Delay 20ms if frame freq $\approx$ 100Hz
4	Write RAM on the beginning column of the scrolling window (Page 2 to 5, Col 120) <i>(Content update in beginning column)</i>	0	21h	Set Column address
		0	78h	Set column start address for Vertical Addressing Mode
		0	78h	Set column end address for Vertical Addressing Mode
		0	22h	Set Page address
		0	02h	Set start page address for Vertical Addressing Mode
		0	05h	Set end page address for Vertical Addressing Mode
		1	-	Write data to fill the RAM
5	<b>i=i+1</b>	-	-	Go to next “For loop”
	<b>Delay timing</b>	-	-	Set time interval between each scroll step if necessary
	<b>End</b>			

## 11 MAXIMUM RATINGS

Table 11-1 : Maximum Ratings (Voltage Referenced to  $V_{SS}$ )

Symbol	Parameter	Value	Unit
$V_{DD}$	Supply Voltage	-0.3 to +4	V
$V_{CC}$		0 to 17	V
$V_{SEG}$	SEG output voltage	0 to $V_{CC}$	V
$V_{COM}$	COM output voltage	0 to $0.9 \cdot V_{CC}$	V
$V_{in}$	Input voltage	$V_{SS}-0.3$ to $V_{DD}+0.3$	V
$T_A$	Operating Temperature	-40 to +85	°C
$T_{stg}$	Storage Temperature Range	-65 to +150	°C

Maximum ratings are those values beyond which damages to the device may occur. Functional operation should be restricted to the limits in the Electrical Characteristics tables or Pin Description section.

This device may be light sensitive. Caution should be taken to avoid exposure of this device to any light source during normal operation. This device is not radiation protected.

## 12 DC CHARACTERISTICS

**Condition (Unless otherwise specified):**

Voltage referenced to  $V_{SS}$ ,  $V_{DD} = 1.65\text{ V to }3.3\text{V}$ ,  $T_A = 25^\circ\text{C}$

**Table 12-1 : DC Characteristics**

Symbol	Parameter	Test Condition	Min	Typ	Max	Unit
$V_{CC}$	Operating Voltage	-	7	-	16	V
$V_{DD}$	Logic Supply Voltage	-	1.65	-	3.3	V
$V_{OH}$	High Logic Output Level	$I_{OUT} = 100\mu\text{A}$ , 3.3MHz	$0.9 \times V_{DD}$	-	-	V
$V_{OL}$	Low Logic Output Level	$I_{OUT} = 100\mu\text{A}$ , 3.3MHz	-	-	$0.1 \times V_{DD}$	V
$V_{IH}$	High Logic Input Level	-	$0.8 \times V_{DD}$	-	-	V
$V_{IL}$	Low Logic Input Level	-	-	-	$0.2 \times V_{DD}$	V
$I_{DD,SLEEP}$	Sleep mode Current	$V_{DD} = 1.65\text{V}\sim 3.3\text{V}$ , $V_{CC} = 7\text{V}\sim 16\text{V}$ Display OFF, No panel attached	-	-	10	$\mu\text{A}$
$I_{CC,SLEEP}$	Sleep mode Current	$V_{DD} = 1.65\text{V}\sim 3.3\text{V}$ , $V_{CC} = 7\text{V}\sim 16\text{V}$ Display OFF, No panel attached	-	-	10	$\mu\text{A}$
$I_{CC}$	$V_{CC}$ Supply Current $V_{DD} = 2.8\text{V}$ , $V_{CC} = 12$ , $I_{REF} = 10\mu\text{A}$ , No loading, Display ON, All ON	Contrast = FFh	-	450	580	$\mu\text{A}$
				$I_{DD}$	$V_{DD}$ Supply Current $V_{DD} = 2.8\text{V}$ , $V_{CC} = 12$ , $I_{REF} = 10\mu\text{A}$ , No loading, Display ON, All ON,	
$I_{SEG}$	Segment Output Current, $V_{DD} = 2.8\text{V}$ , $V_{CC} = 12\text{V}$ , $I_{REF} = 10\mu\text{A}$ , Display ON.	Contrast=FFh	280	310	340	$\mu\text{A}$
		Contrast=AFh	-	215	-	
		Contrast=7Fh	-	155	-	
		Contrast=3Fh	-	78	-	
		Contrast=0Fh	-	20	-	
Dev	Segment output current uniformity	$Dev = (I_{SEG} - I_{MID})/I_{MID}$ $I_{MID} = (I_{MAX} + I_{MIN})/2$ $I_{SEG}[0:127] = \text{Segment current at contrast setting} = \text{FFh}$	-3	-	3	%
Adj. Dev	Adjacent pin output current uniformity (contrast setting = FFh)	$Adj\ Dev = (I[n] - I[n+1]) / (I[n] + I[n+1])$	-2	-	2	%

## 13 AC CHARACTERISTICS

### Conditions:

Voltage referenced to  $V_{SS}$

$V_{DD}=1.65$  to  $3.3V$

$T_A = 25^{\circ}C$

**Table 13-1 : AC Characteristics**

Symbol	Parameter	Test Condition	Min	Typ	Max	Unit
FOSC <sup>(1)</sup>	Oscillation Frequency of Display Timing Generator	$V_{DD} = 2.8V$	360	450	540	kHz
FFRM	Frame Frequency	128x64 Graphic Display Mode, Display ON, Internal Oscillator Enabled	-	$F_{OSC} \times 1/(D \times K \times 64)$ <sup>(2)</sup>	-	Hz
RES#	Reset low pulse width		3	-	-	us

### Note

<sup>(1)</sup> Fosc stands for the frequency value of the internal oscillator and the value is measured when command D5h A[7:4] is in default value.

<sup>(2)</sup> D: divide ratio (default value = 1)

K: number of display clocks per row period (default value = 69)

Please refer to 9.5 (Set Display Clock Divide Ratio/Oscillator Frequency, D5h) for detailed description

Table 13-2 : 6800-Series MCU Parallel Interface Timing Characteristics

$t_F$	Fall Time	-	-	40	ns

**Figure 13-4 : Serial interface characteristics (3-wire SPI)**

**Conditions:**

$$V_{DD} - V_{SS} = 1.65V \sim 3.3V$$

$$T_A = 25^\circ C$$

**Table 13-6 : I<sup>2</sup>C Interface Timing Characteristics**

Symbol	Parameter	Min	Typ	Max	Unit
t <sub>cycle</sub>	Clock Cycle Time	2.5	-	-	us
t <sub>HSTART</sub>	Start condition Hold Time	0.6	-	-	us
t <sub>HD</sub>	Data Hold Time (for “SDA <sub>OUT</sub> ” pin)	0	-	-	ns
	Data Hold Time (for “SDA <sub>IN</sub> ” pin)	300	-	-	ns
t <sub>SD</sub>	Data Setup Time	100	-	-	ns
t <sub>SSTART</sub>	Start condition Setup Time (Only relevant for a repeated Start condition)	0.6	-	-	us
t <sub>SSTOP</sub>	Stop condition Setup Time	0.6	-	-	us
t <sub>R</sub>	Rise Time for data and clock pin	-	-	300	ns
t <sub>F</sub>	Fall Time for data and clock pin	-	-	300	ns
t <sub>IDLE</sub>	Idle Time before a new transmission can start	1.3	-	-	us

**Figure 13-5 : I<sup>2</sup>C interface Timing characteristics**

## 14 Application Example

Figure 14-1 : Application Example of SSD1309Z

The configuration for I<sup>2</sup>C interface mode is shown in the following diagram:  
 (V<sub>DD</sub>=2.8V, V<sub>CC</sub>=12V, I<sub>REF</sub>=10uA)

Pin connected to MCU interface: D[2:0], RES#  
 Pin internally connected to V<sub>SS</sub>: D[7:3], BS0, BS2, E, R/W#, CS#, CL, V<sub>SS1</sub>  
 Pin internally connected to V<sub>DD</sub>: BS1, CLS  
 TR[7:0] should be left open.  
 D/C# acts as SA0 for slave address selection <sup>(3)</sup>

C1, C2: 2.2uF <sup>(1)</sup>  
 C3: 1.0uF <sup>(1)</sup> place close to IC V<sub>DD</sub> and V<sub>SS</sub> pins on PCB  
 R<sub>p</sub> : Pull up resistor

Voltage at I<sub>REF</sub> = V<sub>CC</sub> - 3V. For V<sub>CC</sub> = 12V, I<sub>REF</sub> = 10uA:  
 $R1 = (\text{Voltage at } I_{REF} - V_{SS}) / I_{REF}$   
 $\approx (12-3)V / 10\mu A$   
 $= 900K\Omega$

**Note**

- <sup>(1)</sup> The capacitor value is recommended value. Select appropriate value against module application.
- <sup>(2)</sup> Die gold bump face down.
- <sup>(3)</sup> Refer to Section 8.1.5 for details.
- <sup>(4)</sup> It is recommended to tie V<sub>LSS</sub> and V<sub>SS</sub> at one common ground point to minimize circulating ground noise.

# 15 PACKAGE INFORMATION

## 15.1 SSD1309Z Die Tray Information

Figure 15-1: SSD1309Z die tray information

**Remarks:**

1. Tray material: Permanent Antistatic
2. Tray color code: Black
3. Surface resistance  $10^9 \sim 10^{12} \Omega$
4. Pocket bottom: Rough Surface

Parameter	Dimensions	
	mm	(mil)
W1	76.00±0.10	(2992)
W2	68.00±0.10	(2677)
W3	68.30±0.10	(2689)
$D_x$	8.40±0.10	(331)
$TP_x$	59.20±0.10	(2331)
$D_y$	5.50±0.10	(217)
$TP_y$	65.00±0.10	(2559)
$P_x$	7.40±0.05	(291)
$P_y$	2.60±0.05	(102)
X	5.85±0.05	(230)
Y	1.02±0.05	(41)
Z	0.40±0.05	(16)
N (pocket number)	234	

## 15.2 SSD1309UR1 Detail Dimension

Figure 15-2 SSD1309UR1 Detail Dimension

**NOTE:**

1. GENERAL TOLERANCE:  $\pm 0.05\text{mm}$
2. MATERIAL  
 PI:  $38 \pm 3.5\mu\text{m}$   
 CU:  $8 \pm 2\mu\text{m}$   
 SR:  $10 \pm 5\mu\text{m}$   
 (OTHER TOLERANCE:  $\pm 0.200\text{mm}$ )
3. SN PLATING:  $0.20 \pm 0.05\mu\text{m}$
4. TAPESITE: 4 SPH, 19.0mm

Detail of Alignment Mark

Solomon Systech reserves the right to make changes without notice to any products herein. Solomon Systech makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does Solomon Systech assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any, and all, liability, including without limitation consequential or incidental damages. "Typical" parameters can and do vary in different applications. All operating parameters, including "Typical" must be validated for each customer application by the customer's technical experts. Solomon Systech does not convey any license under its patent rights nor the rights of others. Solomon Systech products are not designed, intended, or authorized for use as components in systems intended for surgical implant into the body, or other applications intended to support or sustain life, or for any other application in which the failure of the Solomon Systech product could create a situation where personal injury or death may occur. Should Buyer purchase or use Solomon Systech products for any such unintended or unauthorized application, Buyer shall indemnify and hold Solomon Systech and its offices, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that Solomon Systech was negligent regarding the design or manufacture of the part.

The product(s) listed in this datasheet comply with Directive 2002/95/EC of the European Parliament and of the council of 27 January 2004 on the restriction of the use of certain hazardous substances in electrical and electronic equipment and People's Republic of China Electronic Industry Standard SJ/T 11363-2006 "Requirements for concentration limits for certain hazardous substances in electronic information products (电子信息产品中有毒有害物质的限量要求)". Hazardous Substances test report is available upon request.
